

Yield Increase from 14% to 28%

With almost 1000 needles and a new distribution system, the enhanced head give better results than expected.

For our demonstration, we took an older injecting machine and we changed out the needle bridge (with 589 needles) to the newly developed type with almost double the number of needles. This was simply done without having to do any adjustments to the injector itself. With the increased number of needles the higher yields were easily achieved. Further adjustments can even increase pick up further as desired. Our customers and our experience state that there is strong relationship between the higher pick-up at the injecting machine and the packing yield. This relationship is a positive one; the higher the pick-up the higher the final packing yield.

The new TR-850 injecting machine with 1,65 mm thick OD (outer diameter) needles work very well on salmon fillets as well as on other soft tissue fish. We now offer many different OD needles; in various sizes such as 1,65, 1,80, 2,00, 2,35 or 2,70 mm needles.

TR-850 injecting machine with 968 needles and one injecting head has the same production capacity as machines from our competitors that require you to purchase two heads and/or two needle bridges. A unique Traust Know-How advanced and flexible central control program makes it easy to preset the pick-up independent of the capacity adjustments. In other words Traust Know How allows you to control the injection level irrespective of the speed of the injector, allowing for increased production capacity. More importantly, the new needle bridge gives the processor the ability to inject at dramatically lower pressure thereby preventing damage such as spalling in the fillets.

TR-850 Injector - The Best Choice at a Reasonable Price

Low exchange rates make it possible to save when buying now!

As the value of the Icelandic Crown is low at the moment, the situation allows the buyer to choose high quality injecting machines for "reasonable prices," especially when compared to other producers. The Icelandic financial crisis has resulted in conditions whereby your firm can now choose this

We rebuild older machines

We invite all of you who are interested in injecting products to contact us and find out what possibilities can be made true through the use of the Traust Injecting System. We can rebuild older machines. We can easily put the new 968 needle bridge on older systems, thereby offering you the increased capacity and yield. We can also offer completely rebuilt machines, which can deliver the same results as new injectors for really good prices.

Ultimately, the most reliable and least complex machine on the market that will deliver top results
